

Air handling unit

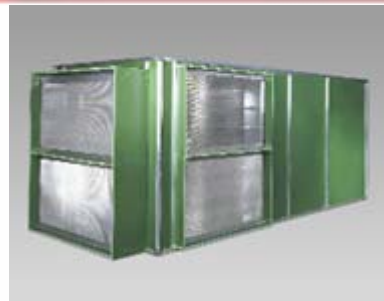

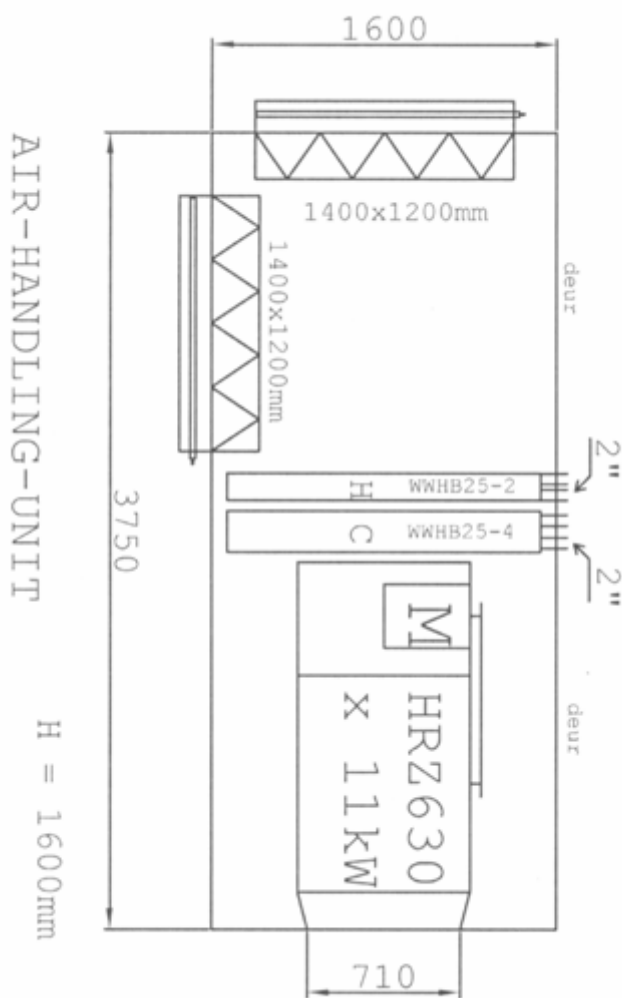

Air handling unit

The Pas Reform air handling unit provides the necessary ventilation in the hatchery. The unit has a mixing section where external air is mixed with air from the hatchery. This mixed air then passes through a heating and/or cooling element so that it is blown in at the right temperature. A high-pressure centrifugal fan blows the air into a duct system which leads to the various departments. The pressure of the ventilation is controlled by a specially designed control computer.

Air handling unit

Technical Specifications Air handling unit

Type	150/15	Phase	3
Cylinders	3	Voltage (V)	230/400
Spray pressure		Current (A)	10
Maximum bar**	150	Frequency (Hz)	50
Water consumption		Power (kW)	4
L/min	15		
L/hour	900
