

Vacuum egg lifter

The Pas Reform vacuum egg lifter is a masterpiece in engineering design: lightest weight of all and complete visibility

Egg lifter

The lifter interior is smooth bore all the way – from handle to cup. No projecting studs, depressions or mismatched welded joints to accumulate dirt. Cleaning is required far less often than is necessary with metal tube lifters. A threaded plug at the handle end is easily removed to permit access to the handle interior when cleaning is required. All tube ends have non-binding caps easily removed and replaced. A simple and unique valve assembly! The only wearing part is the valve seat which is an ordinary neoprene washer replaceable in seconds. A worn washer is simply pulled off the valve lever collar and new one pressed on. The valve construction allows the full use of the valve port area. There is no internal stem or plunger to reduce the effective area. Release of the eggs is immediate when the valve lever is depressed.
