

Mobile spray vaccinator

The mobile spray vaccinator from Pas Reform is a semi-automatic cabinet sprayer for the application of poultry vaccines to day-old chickens by the spray method. This method is normally recommended for IB, ND and SHS/TRT vaccines.

The Vaccinator

The user places a crate with chickens on the rollers and an exact dose of product is sprayed onto the birds. The unit is completely based on pneumatic functioning. This avoids the use of electricity, which reduces problems and risks when using the unit in a humid environment. The cabinet makes use of a roller system which makes handling extremely light and which places crates automatically in good position. The spray is started and stopped by an automatic pistol that meets the highest standards and has been manufactured for intensive use. Spray-time can be set upon your requirements and once the spray is on, a red warning light shows the user that the crate should not be removed. The compressed air arrival should be between 3 and 8 Bars and passes through an air-filter and pressure regulator before use in the unit. A pneumatic counter fixed in the control unit counts all crates sprayed on.
