

Spray vaccinator

The Pas Reform spray vaccinator automatically vaccinates day old chicks

Spray vaccinating

The Pas Reform spray vaccinator (IBS-1) has been developed to automatically vaccinate day old chicks against infectious bronchitis and/or Newcastle disease. The machine consists of a bridge, so that the automatic spray installation can be placed over the output conveyor of the Pas Reform chick counting and boxing system. The vaccine is sprayed by means of compressed air. The vaccinator can be easily refilled during operation.
