

Field site visits

The Pas Reform Project Management team works hand-in-hand with your company to develop hatchery-specific strategies that optimise the most efficient, performance-enhancing combination of incubators, hatchery climate control systems and automation systems.

Examples

- Design meeting on site to establish contact with the design team and contractor in order to discuss construction schedules (i.e. anticipated project completion date and the schedule for each project phase), answer any questions the contractor may have, and explain the Pas Reform installation procedure.
- Inspection meeting on site before installation of the Pas Reform equipment, to evaluate compliance with Pas Reform's design specifications and to ensure that the equipment operates profitably, reliably and safely.
- Guidance meeting on site to guide personnel through hatchery operation after installation, and to focus on key aspects of hatchery management that impact on efficiency and quality, such as machine management and chick handling. With in-depth inspection of your hatchery equipment and including plant start-up services to assist you with the commissioning of your new hatchery.
